FRAC IRON RESTRAINTS

Providing Protection From High-Pressure Flow Lines

WORKER PROTECTION

EQUIPMENT PROTECTION

HIGH-PRESSURE PIPING

Barricade utilizes the highest quality frac iron restraints in workplace locations where dangerous high-pressure flow lines are present.

The destructive force of an unrestrained flow line can be catastrophic to both people and equipment. Properly installed frac iron restraints help contain high-pressure piping and components, in the case of flow line rupture during pumping operations.

The system uses interlocking synthetic loops that are strung the entire length of the flow line, and attached to critical points of the flow line through smaller loops. The assembly is anchored to a substantial structural tie-down location, such as the pumping unit or other similar structure.

Common uses for Frac Iron Restraints are:

- Flowback
- Fracking
- Cementing
- Drilling
- Well Service
- Well Completion

OUR FRAC IRON RESTRAINTS ARE BENEFICIAL IN THE FOLLOWING WAYS:

- Demonstrated Effectiveness
- Extreme Strength and Reliability
- Experienced Installation Crews
- Flexible and Lightweight
- Easy to Install and Maintain
- Applicable for Fluid and Gas Pumping Operations
- Easy to Transport
